Instructions:

- i. This is a 50 minute exam. There are 4 problems, worth a total of 50 points.
- ii. The exam consists of 5 pages. You may write on the back of pages if you need more space.
- iii. Remember to show your work. Answers lacking adequate justification may not receive full credit.
- iv. You may quote and use (without proving) any result proved in class or given in homework.
- v. You may use one letter-sized sheet of your own notes *hand-written* on both sides and a scientific calculator. (You are not required to bring a calculator – you may leave your answers in a form from which the numerical answer could be immediately calculated.)
- vi. You may not use any books, other references, or any other electronic devices during the exam.

-
1. Customer arrivals at a checkout counter in a department store have a Poisson distribution with an average of forty nine per hour.
 - (a) Find the probability that exactly 25 customers arrive in a given hour.
 - (b) If it is known that in a given hour the number of customers arriving at the counter is at most one, what is the probability that during that period of time actually no customer arrives?
 - (c) Use Chebyshev's theorem to find an interval that contains the number of customers arriving in a given hour with at least 75% probability.
 2. When fishing off the shores of Florida, a spotted sea trout must be between 14 and 30 inches long before it can be kept; otherwise it must be returned to the waters. In a region of the Gulf of Mexico, the lengths of the spotted sea trout that are caught, are normally distributed with a mean of 22 inches, and a standard deviation of 4 inches, i.e, $\mu = 22$ and $\sigma = 4$. Use the well known "empirical law" [$P(-1 \leq Z \leq 1) \approx 0.68$, $P(-2 \leq Z \leq 2) \approx 0.95$, and $P(-3 \leq Z \leq 3) \approx 1$, where Z is a standard normal variable] to solve the following problems.
 - (a) What is the probability that a fisherman catches a spotted sea trout within the legal limits?

- (b) Find x such that the probability that the length of a randomly caught sea trout is less than or equal to x , is 0.5.
- (c) Now suppose σ is unknown and can be varied. Find the maximum allowable value for σ which ensures that a randomly caught sea trout is almost certainly within the legal limits.

3. A RV Y is said to have the *standard double exponential* distribution if it has PDF

$$f(y) = Ce^{-|y|}, \quad -\infty < y < \infty,$$

- (a) Provide an appropriate choice for the constant C that makes f a PDF.
 - (b) Find $E(Y)$.
 - (c) Find $V(Y)$.
4. (a) Let X be a continuous RV with support \mathcal{X} , and CDF F satisfying $F(x) + F(-x) = 1$ for all $x \in \mathcal{X}$. What can be said about the distribution of X ?
- (b) Let $X \sim U(0, 1)$. Show that $Y = 1 - X$ has the same distribution as X . [**Hint:** Use MGF.]
