1. Fin the domain of the following function.

$$
\begin{equation*}
f(x)=\ln \left(\frac{\sqrt{x^{2}-4}}{x+6}\right) \tag{1}
\end{equation*}
$$

2. The position of a particle as a function of time is given by the relation

$$
\begin{equation*}
x(t)=t^{2}+4 t-1 \tag{2}
\end{equation*}
$$

Fix the point $p=(-1,-4)$ on this function. Find the general equation of secant line passing through p and an arbitrary point of $\mathrm{x}(\mathrm{t})$.
3. Find the limit.

$$
\begin{equation*}
\lim _{x \rightarrow 3} \frac{\sqrt{x^{2}-3}-\sqrt{6}}{x^{2}-2 x-3} \tag{3}
\end{equation*}
$$

hint: Rationalize the numerator!
