PST in normal Cayley graphs is covered by PST characterization for association schemes (Coutinho et.al). If Cay(G, S) has PST from g to h then h = gz for some central involution z.

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

PST in normal Cayley graphs is covered by PST characterization for association schemes (Coutinho et.al). If Cay(G, S) has PST from *g* to *h* then h = gz for some central involution *z*.

Theorem

Let z be central involution in G. In Cay(G, S) we have PST between vertices g and h = gz at some time if and only if the following hold.

- (a) The eigenvalues are integers.
- (b) Let $\Phi^+ = \{\theta_{\chi} | \chi(z) > 0\}$ and $\Phi^- = \{\theta_{\chi} | \chi(z) < 0\}$. There is an integer N such that

・ロト ・ 同 ・ ・ ヨ ・ ・ ヨ ・ うへつ

- (i) for all $\theta_{\chi} \in \Phi^{-}$, $v_2(\theta_{\chi} \theta_1) = N$; and
- (ii) for all $\theta_{\chi} \in \Phi^+$, $v_2(\theta_{\chi} \theta_1) > N$.

Character theory is much more complicated.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

- Character theory is much more complicated.

- ► As an example, for the groups SL(2, q), q = p^a, a possible connection set consists of all elements of order p and 2p, together with central involution -1.
- Generalization to higher dimensions may be difficult, as the irreducible characters fall into families, whose number grows fast with respect to dimension.

Let *G* be a quasisimple group (a perfect central extension of a simple group) with a central involution. *G* is generated by any noncentral conjugacy class *C*, so if *C* is real (closed under inverses), then Cay(G, C) is a connected normal Cayley graph.

・ロト ・ 同 ・ ・ ヨ ・ ・ ヨ ・ うへつ

Lemma

Let C be a real conjugacy class of G and $x \in C$. Suppose, for all $\chi \in Irr(G)$, that $\chi(x)$ is an integer and $\frac{|C|\chi(x)}{\chi(1)} - |C| \equiv 0 \pmod{4}$. Then we have PST at $t = \frac{\pi}{2}$ in Cay(G, S), where $S = C \cup \{z\}$

Proof.

$$\begin{aligned} \theta_{\chi} - \theta_{1} &= (\frac{|C|(\chi(x)) + \chi(z))}{\chi(1)} - (|C| + 1) \\ &= (\frac{|C|(\chi(x)))}{\chi(1)} - |C|) + (\frac{\chi(z)}{\chi(1)} - 1) \end{aligned}$$

Thus

$$\theta_{\chi} - \theta_1 \cong \begin{cases} 2 \pmod{4}, & \text{if } \chi(z) = -1; \\ 0 \pmod{4}, & \text{if } \chi(z) = 1. \end{cases}$$
