Let X be a set of n elements. What is the maximum size M of a family of subsets of size k such that any two subsets in the family have nonempty intersection?

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Let X be a set of n elements. What is the maximum size M of a family of subsets of size k such that any two subsets in the family have nonempty intersection?

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

We may assume  $k \leq n/2$ .

Let X be a set of n elements. What is the maximum size M of a family of subsets of size k such that any two subsets in the family have nonempty intersection?

(日) (日) (日) (日) (日) (日) (日)

We may assume  $k \leq n/2$ .

#### Theorem

 $M = \binom{n-1}{k-1}$ . Furthermore, if k < n/2, then a maximum familiy must be the family of k-subsets containing a fixed element.

- Perfect matchings (K. Meagher, L. Moura, 2005)
- k-tuples (M. Livingston, 1979)
- Permutations: View a permutation g as a set of pairs (i, g(i). Two permutations g and h intersect iff for some i we have g(i) = h(i) iff g<sup>-1</sup>h lies in the stabilizer of a point. Thus the elements of a point stabilizer form an intersecting set.

(Burnside). If (G, X) is a 2-transitive permutation group then one of the following holds.

- (a) |X| is a prime power p<sup>r</sup>, and G has a normal, elementary abelian subgroup N acting regularly on X.
- (b) G is an almost simple nonabelian group.

in case (a)  $G = N \rtimes G_x$ . ( $G_x$  = stabilizer of  $x \in X$ )

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

(Burnside). If (G, X) is a 2-transitive permutation group then one of the following holds.

- (a) |X| is a prime power p<sup>r</sup>, and G has a normal, elementary abelian subgroup N acting regularly on X.
- (b) G is an almost simple nonabelian group.

in case (a)  $G = N \rtimes G_x$ . ( $G_x =$  stabilizer of  $x \in X$ )

*N* is a clique. So the clique-coclique bound implies that *G* has the EKR property.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

(Burnside). If (G, X) is a 2-transitive permutation group then one of the following holds.

- (a) |*X*| is a prime power p<sup>r</sup>, and G has a normal, elementary abelian subgroup N acting regularly on X.
- (b) G is an almost simple nonabelian group.

in case (a)  $G = N \rtimes G_x$ . ( $G_x$  = stabilizer of  $x \in X$ )

*N* is a clique. So the clique-coclique bound implies that *G* has the EKR property.

Example:  $(G, X) = (\mathbb{F}_q \rtimes \mathbb{F}_q^{\times}, \mathbb{F}_q)$ . Here  $\Gamma_G$  is a disjoint union of cliques. Any choice of one vertex from each clique gives a maximum coclique. So *G* does not have the strict EKR property.

## All 2-transitive groups have EKR property

Theorem

(Meagher, Spiga, Tiep, 2016). Every 2-transitive permutation group has the EKR property.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

(Meagher, Spiga, Tiep, 2016). Every 2-transitive permutation group has the EKR property.

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Proof requires the classification of finite simple groups.

(Meagher, Spiga, Tiep, 2016). Every 2-transitive permutation group has the EKR property.

Example of almost simple group not satisfying strict EKR property: (G, X) = (PGL(3, q), PG(2, q)), line-stabilizers are also maximum intersecting sets.

$$\begin{pmatrix} * & * & * \\ * & * & * \\ 0 & 0 & \lambda \end{pmatrix}$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

(Meagher, Spiga, Tiep, 2016). Every 2-transitive permutation group has the EKR property.

Example of almost simple group not satisfying strict EKR property: (G, X) = (PGL(3, q), PG(2, q)), line-stabilizers are also maximum intersecting sets.

$$\begin{pmatrix} * & * & * \\ * & * & * \\ 0 & 0 & \lambda \end{pmatrix}$$

P. Spiga (2019): In (PGL(n, q), PG(n - 1, q) Maximum intersecting sets must be cosets of point stabilizers or hyperplane stabilizers.

(日) (日) (日) (日) (日) (日) (日)

In the case  $G = N \rtimes G_x$  then another way to construct noncanonical examples is by considering nonstandard complements of *N* in *G*. We've seen some examples of noncanonical max. intersecting sets for 2-transitive groups (Frobenius groups, hyperplane stabilizers in PGL(n, q)).

In the case  $G = N \rtimes G_x$  then another way to construct noncanonical examples is by considering nonstandard complements of *N* in *G*.

Conjugacy classes of complements to N are classified by  $H^1(G_x, N)$ .

(日) (日) (日) (日) (日) (日) (日)

We've seen some examples of noncanonical max. intersecting sets for 2-transitive groups (Frobenius groups, hyperplane stabilizers in PGL(n, q)).

In the case  $G = N \rtimes G_x$  then another way to construct noncanonical examples is by considering nonstandard complements of *N* in *G*.

Conjugacy classes of complements to N are classified by  $H^1(G_x, N)$ .

#### Lemma

If H is a nonstandard complement to N and each p-element of H is conjugate to an element of  $G_x$ , then H is a noncanonical maximum intersecting set.

# Example

$$G = N \rtimes SL(2,4), N = \mathbb{F}_4^2$$
, viewed as matrices  $\begin{pmatrix} L & v \\ 0 & 1 \end{pmatrix}$ , where  $L \in SL_2(4)$  and  $v \in \mathbb{F}_4^2$ .

``

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●

# Example

$$\begin{split} & G = N \rtimes \mathrm{SL}(2,4), \, N = \mathbb{F}_4^2, \, \text{viewed as matrices} \, \begin{pmatrix} L & v \\ 0 & 1 \end{pmatrix}, \, \text{where} \\ & L \in \mathrm{SL}_2(4) \text{ and } v \in \mathbb{F}_4^2. \\ & \text{Here we have } H^1(\mathrm{SL}(2,4,N) \cong \mathbb{F}_4. \end{split}$$

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● □ ● ● ● ●

### Example

$$G = N \rtimes SL(2,4), N = \mathbb{F}_4^2$$
, viewed as matrices  $\begin{pmatrix} L & v \\ 0 & 1 \end{pmatrix}$ , where  $L \in SL_2(4)$  and  $v \in \mathbb{F}_4^2$ .  
Here we have  $H^1(SL(2,4,N) \cong \mathbb{F}_4$ .  
The elements

$$t = \begin{pmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}, \qquad u = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{pmatrix} \qquad s = \begin{pmatrix} 0 & 1 & 0 \\ 1 & \alpha & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

( $\alpha$  a primitive root) have orders 2, 2 and 5. The subgroup  $\langle t, s \rangle$  is a point stabilizer, while  $\langle tu, s \rangle$  is a nonstandard complement, satisfying the hypothesis of the Lemma.

/ .

The End. Thank you!
